"Murine complement C2 and factor B genomic and cDNA cloning reveals
different mechanisms for multiple transcripts of C2 and B.";
J. Biol. Chem. 265:19040-19046(1990).

-I- FUNCTION: COMPONENT C2 WHICH IS PART OF THE CLASSICAL PATHWAY OF
THE COMPLEMENT SYSTEM IS CLEAVED BY ACTIVATED FACTOR C1 INTO TWO
THE COMPLEMENT FACTOR 4B TO GENEVATE THE C3 OR C5 CONVERTASE.

-I- CATALYTIC ACTIVITY: CLEAVES C3 IN THE ALPHA-CHAIN TO YIELD C3A AND
C13B. CLEAVES C5 IN THE ALPHA-CHAIN TO YIELD C3A AND C5E. BOTH
CLEAVEGES TAKE PLACE AT THE C-TERNING OF AN AGININE RESIDUE.

-I- MISCELLANBOUS: C2 IS A MAJOR HISTOCOMPATIBILITY COMPLEX CLASS-III
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       -!- SIMILARITY: WITH COMPLEMENT FACTOR B.
-!- SIMILARITY: CONTAINS 3 SUSHI (SCR) DOMAINS.
-!- SIMILARITY: CONTAINS 1 VWFA DOMAIN.
-!- SIMILARITY: BELONGS TO PEPTIDASE FAMILY S1; ALSO KNOWN AS THE
                                                                                                                                                           Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

Genomics 41:236-242(1997).

1- FUNCTION: TYPE XII COLLAGEN INTERACTS WITH TYPE I COLLAGEN-
CONTAINING FIRELS, THE COLL DOMAIN COULD BE ASSOCIATED WITH THE
SUBRACCE OF THE FIRERILAR MATRIX (92 SIMILARITY).

1- SUBUNIT: TRIMER OF IDENTICAL REQUENCES.

NOWTRIPEL-HELICAL SEQUENCES.

1- ALTERNATIVE PRODUCTS: 2 ISOFORMS; A LONG FORM (SHOWN HERE) AND A
SHORT FORM; ARE PRODUCED BY ALTERNATIVE SPLICING; THE FINAL TISSUE
FORM OF COLLAGEN XII MAY CONTAIN HOMOTRIBERS OF EITHER THE LONGER
OR THE SHORTER ISOFORM OR ANY COMBINATION OF LONG AND SHORT
ISOFORM CHAINS. ONLY THE LONG VARIANT IS A PROPEGLICAN.

1- TISSUE SPECIFICITY: FOUND IN COLLAGEN I-CONTAINING TISSUES: BOTH
SHORT AND LONG ISOFORMS APPERR IN AMMION, CHORION, SKELETAL
MUSCLE, SMALL INTESTINE, AND IN CELL CULTURE OF DERMAL
HUSCLES, KERATINOCYTES, AND ENDOTHELIAL CELLS. ONLY THE SHORT
ISOFORM IS FOUND IN LUNG, PLACEBTA, AND A SQUAMOUS CELL
ISOFORM IS FOUND IN LUNG, PLACEBTA, AND A SQUAMOUS CELL
ISOFORM IS FOUND IN LUNG, PLACEBTA, AND A SQUAMOUS CELL
CANCINGMA CELL LINE.

(POTENTIAL).
N-LINKED (GLCNAC. . .) (POTENTIAL).
                               UNIT ARE HYDROXYLATED IN ALL CASES AND BIND CARBOHYDRATE.
PTM: MAY CONTAIN CYSTEINE RESIDUES INVOLVED IN INTER- AND
INTRAMOLECULAR DISULFIDE BONDING.
SIMILARITY: BELONGS TO THE FIBRIL-ASSOCIATED COLLAGENS WITH
INTERRUPTED HELICES (FACIT) FAMILY.
SIMILARITY: CONTAINS 2 VWEA DOMAINS.
SIMILARITY: CONTAINS 6 FIBRONECTIN TYPE III-LIKE DOMAINS.

cDNA library was prepared and sequenced in Mouse Genome Encyclopedia Project of Genome Exploration Research Group in Riken Genomic Sciences Center and Genome Science Laboratory in RIKEN.

Division of Experimental Animal Research in Riken contributed to prepare mouse tissues. First strand cDNA was primed with a primer [5, GAGAGAAGAAAGATCAAGAGCTTTTTTTTTTTTTTTTTYN 3'), cDNA was prepared by using trehalose thermo-activated reverse transcriptase and subsequently enriched for full-length by cap-trapper. cDNA went through one round of normalization to Rot = 7.5 and subtraction to Rot = 37.5. Second strand cDNA was prepared with the primer adapter of sequence [5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   KDHVEPVNDGFQALQOI HIS ILKKSCIEILAAEPSTICAGESFQVVRGGNGFRHARNV

And Androis 300-Androis 379 represent cDNAs corresponding to 28 human secreted protein genes, and AAE01436-AAE01513 represent the proteins they encode. AAE01514-AAE01544 represent human secreted protein fragments or variants. The genes and their secreted proteins are useful for preventing. The genes and their secreted proteins are useful for preventing. The genes and their secreted proteins are useful for preventing. The genes and their secreted proteins are useful for preventing the the rew protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the control for the new genes. Specific uses are described for each of the most of the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities, haematopoietic disorders, diseases of the immune system, AIDS, autoimmune diseases (e.g., rheumatoid arthritis), inflammation, allergies, neurological disorders (e.g., Alzheimer's disorders, cardioase), cognitive disorders, schizophrenia, asthma, cardioascapes, or disease), sepsis, diabetes, atheroscierosis, cardioascapes, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound callsoried to primary tissues, to regenerate tissues, to identify their colluture of primary tissues, to regenerate tissues, to identify their contract light of the properties.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    as a food additive or preservative to modify storage properties.
Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioimmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human
                                                                                                                                                                                                                                                                                                                                                                                                        nucleic acid molecules encoding 28 human secreted proteins for {\it shoot} proventing, treating or ameliorating medical conditions and

```
AAD05300-AAD05379 represent cDNAs corresponding to 28 human secreted protein genes, and AAE0146-AAE01513 represent the proteins they encode. AAE01544-AAE01544 represent human secreted protein fragments or variants. The genes and their secreted proteins are useful for preventing. The genes and their secreted proteins are useful for preventing. It herapy. Pathological conditions can be diagnosed by determining the amount of the new protein in a sample or by determining the presence of mutations in the new genes. Specific uses are described for each of the case passed on the tissues in which they are most highly expressed, and include developing products for the diagnosis or treatment of proliferative disorders, cancer, tumours, foetal and developmental abnormalities; haematopoietic disorders, diseases of the immune system, allergies, neurological disorders (e.g., Alzheimer's disease, albeaner's disease, parkinson's disease), cognitive disorders, schizophrenia, asthma,

skin disorders (e.g., psoriasis), sepsis, diabetes, atherosclerosis, cardiovascular disorders, angiogenic disorders, kidney disorders, gastrointestinal disorders, pregnancy-related disorders, endocrine disorders, and infections. The proteins can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell colluture of primary tissues, to regenerate tissues, to identify their cognate ligands or binding partners, and in chemotaxis, and can be used as a food addittive or preservative to modify storage properties. Antibodies specific for a protein of the invention can be used in alleviating symptoms associated with the disorders mentioned above, and in diagnostic immunoassays e.g., radioinmunoassay or enzyme linked immunosorbent assay (ELISA). The present sequence represents a human secreted protein-encoding cDNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                240

Nucleic acids encoding TANGO polypeptides are useful as modulating agents for regulating cellular processes like asthma, graft versus-host diseases, rheumatoid arthritis, postnasis, inflammatory bowel disease, septic shock, ulcerative colitis, Corbn's disease, chronic myelogenous leukemia, cancer, liver disease, Hodgkin's disease, osteoarthritis, Lyme's disease, cacheria and autoimmune disease, osteoarthritis, Lyme's disease, cacheria and autoimmune disease, e.g. myasthemia gravis, autoimmune diabetes and systemic upus erythematosus. The nucleic acids are also useful for producing Langeonic animals and the TANGO polypeptides themselves. Partial TANGO-128, 140, 197, 212, 213, 224, 239 sequences are useful in forensic biology, for diagnostic assays, prognostic assays, paramacogenomics and for monitoring clinical trials. TANGO pharmacogenomics and for monitoring clinical trials. TANGO comprehenses are suitable for both prophylactic and therapeutic methods for treating a subject at risk of a disorder or having a disorder associated with aberrant TANGO expression. A wide range

The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral nervous to localised neuropathies and central nervous system diseases, such as catarial sclerosis, and Shy-Drager Syndrome. Other uses include the cullisation of the activities as uch as: Immune system suppression, and thrombolytic activity, chemotacilc/chemoKinetic activity, haemostatic and thrombolytic activity, arthritis and inflammation, leukaemias and conter the sequence data for this and inflammation, leukaemias and localistic the sequence data for this context.
                                                                                                                                                                                                                                                                                                                                                                                             ö

                                                                                                                                                                                                                                                                                                                                        δ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to human nucleic acids (AAI57798-AAI61369) and the encoded polypeptides (AAM38642-AAM42213) with nootropic, immunosuppressant and cytostatic activity. The polynucleotides are useful in gene therapy. A composition containing a polypeptide or polynucleotide of the invention may be used to treat diseases of the peripheral nervous system, such as peripheral nervous injuries, peripheral neuropathy and

full-length cDNAs defined in the specification. Where a primer set

comprises: (a) an oligo-dT primer and an oligonucleotide complementary

to the complementary strand of a polynucleotide which comprises one of

the 5602 nucleotide sequences defined in the specification, where the

oligonucleotide comprises at least 15 nucleotides; or (b) a combination

of an oligonucleotide comprising a sequence complementary to the

complementary strand of a polynucleotide which comprises a 5'-end

sequence and an oligonucleotide comprising a sequence complementary to a

polynucleotide which comprises a 3'-end sequence, where the

coligonucleotide which comprises at 1-end is selectides on the combination of

the 5'-end sequence 3'-end sequence 15 selectides and the combination of

the 5'-end sequence 3'-end sequence 15 selectides and the combination of

the specification. The primers at useful for synthesising polynucleotides,

particularly full-length cDNAs. The primers are also useful for the

detection and/or diagnosis of the abnormality of the proteins encoded by

the full-length cDNAs. The primers are also useful for the

detection and/or diagnosis of the abnormality of the proteins encoded by

the full-length cDNAs. The primers are also useful for the

detection and/or diagnosis of the abnormality of the proteins encoded by

the full-length cDNAs. The primers and NAH13618 and

ANH13631 to AAH18412 represent human cDNA sequences; AAH3416 to

ANH3631 to AAH18412 represent human cDNA sequences; and AAH13622
                                                                                                                                                                                                                                                                                                                                                                                                       SS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               represent oligonucleotides, all of which are used in the exemplification of the present invention.

Nucleic acids encoding TANGO polypeptides are useful as modulating agents for regulating cellular processes like asthma, graft versus-host diseases, rheumatoid arthritis, postriasis, inflammatory bowel diseases, septic shock, ulcerative colitis, Crohn's disease, chronic myelogenous leukemia, cancer, liver disease, Hodgkin's disease, osteoathritis, Lyme's disease, cachexia and autoimmune disease, e.g. myasthemia gravis, autoimmune diabetes and systemic lupus erythematosus. The nucleic acids are also useful for producing transgenic animals and the TANGO polypeptides themselves. Partial Crangoli28, 140, 197, 213, 213, 214, 239 sequences are useful in for ensic biology, for diagnostic assays, prognostic assays, paramacogenomics and for monitoring clinical trials. TANGO polypeptides are suitable for both prophylactic and therapeutic methods for treating a subject at risk of a disorder or having a clisorder associated with aberrant TANGO expression. A wide range
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel nucleic acid sequences encoding TANGO-128, 140, 197, 212, 213, 224 and 239 polypeptides useful for the treatment of asthma, rheumatoid arthritis, psoriasis and autoimmune diseases
